WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY

International application No.

PCT/US06/30302

Box No. I Basis of this opinion		
1. With re	gard to the language, this opinion has been established on the basis of:	
\boxtimes	the international application in the language in which it was filed	
	a translation of the international application into, which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1(b)). This opinion has been established taking into account the rectification of an obvious mistake authorized by or notified to this	
3. With r	Authority under Rule 91 (Rule 43bis.1(a)) regard to any nucleotide and/or amino acid sequence disclosed in the international application, this opinion has been shed on the basis of:	
a.	type of material	
	a sequence listing	
	table(s) related to the sequence listing	
b.	format of material	
	on paper .	
	in electronic form	
c.	time of filing/furnishing	
	contained in the international application as filed.	
	filed together with the international application in electronic form.	
	furnished subsequently to this Authority for the purposes of search.	
4	In addition, in the case that more than one version or copy of a sequence listing and/or table(s) relating thereto has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that in the application as filed or does not go beyond the application as filed, as appropriate, were furnished.

I the energy in any of the	preceding buxes is not sufficient

V. 2. Citations and Explanations:

Claims 1-4, 6-10,12 and 13 lack novelty under PCT Article 33(2) as being anticipated by Harris (US 4,200,111).

A tissue excision device comprising: an outer tubular member (15); and an inner tubular member slidingly received within the outer tubular member (19,22); wherein the inner tubular member has a distal end including an upper member (27) and a lower member (28); wherein the device has an open position in which the distal end is fully extended from the outer tubular member (Fig. 1), and a closed position (Fig. 4) in which the distal end is disposed within the outer tubular; and wherein the upper member is biased away from the lower member and is disposed at an open angle relative to the lower member when the device is in the opened position. The open angle is between 5 and 30° and between 8° and 20° (at some point when the device is being pushed out of the tubular member it will the angle will fall within this range). The upper member has a fixed end (21) integral with the inner tubular member and a cutting end adapted to cut tissue (37). The upper member is disposed at a closed angle relative to the lower member when the device is in the closed position, wherein closed angle is between 0° and 5° (Fig. 4). The upper member includes a flexing region between the cutting end and the fixed end, wherein the upper member is adapted to flex about the flexing region (Fig. 9). The cutting end of the upper member extends toward the central axis of the inner tubular member at a bent region to form a tooth (31, Fig. 9). The bent region has a curved outer surface. The lower member includes a fixed end (21) integral with the inner tubular member and a cutting end (33) adapted to cut tissue. The lower member is coaxial with the outer tubular member. The outer tubular member includes an annular cutting edge adapted to cut tissue.

Claims 5, 11 and 14-19 lack an inventive step under PCT Article 33(3) as being obvious over Harris (US 4,200,111). Harris does not discloses the length of the upper member. However, at the time the invention was made, it would have been an obvious matter of design choice to a person of ordinary skill in the art to change the length of the upper member to fit within the claimed range, since such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art.

Harris does not disclose that the cutting end of the lower member has a cutting tip with a beveled edge defined by an acute angle, between 15° and 45°. However it is well known in the art to provide a beveled edge to aid in the function of cutting. It would have been an obvious matter of design choice to a person of ordinary skill in the art to change the angle of the beveled edge to fit within the claimed range, since such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art.

Harris does not disclose a plunger slidingly received within the inner tubular

Form PCT/ISA/237 (Supplemental Box) (April 2007)

WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

member. However it is well known in the art to incorporate a plunger for the purposes of removing the specimens that have been retrieved by the device. Therefore adding the feature of a plunger would not be novel.

Harris discloses the steps for using the cutting device as claimed but does not disclose that the method is for treating stenosis in a spine. However, it would have been obvious to adapt the device for retrieving tissue into a method of treating a spine since the need for removing tissue from a spine for treatment of the spine is well known in the art.

Harris does not disclose a kit for performing a procedure on a spine comprising an insertion member for accessing the epidural space and a volume of a contrast medium. However, it is well known in the art to use a trocar or introducing catheter for the purposes of providing easy access to the area of treatment. It is further well known to use contrast medium to simplify the procedure by marking the location of the procedure prior to delivering devices to the area. Therefore it would have been well within the skill of the ordinary artisan to incorporate these elements into a kit for use by a surgeon during one procedure.

Claims 1-19 meet the criteria set out in PCT Article 33(4), and thus have industrial applicability because the subject matter claimed can be made or used in industry.
